

Introduction

ABB has great experience in offering Crane and Hoist duty motors both for DOL operation as well as for VFD applications.

They conform to IS : 325 for Three-phase Induction Motors and IS : 4722 for Rotating Electrical Machines .The size of the motor is governed by the mechanical effects of starting and braking fuctions, the type of control and the number of switching per hour. The rated output, the number of starts/hour and the inertia (i.e load GD2 +rotor GD2) are interdependent.

With drive , its become utmost important that the motors are selected suitably considering the load details. The selection of motors is done through dedicated ABB software **Drive Size™** which takes care of all the proper margins required as per application . Thus ensuring motors can be used for longer period of time with optimum performance levels.

Scope:-

Crane duty Motors suitable for DOL & VFD applications.

DOL

Frame- 71-200

KW rating:-0.37KW to 30KW

Pole:-4, 6 & 8 pole

CDF:- 25%, 40%, 60%, 100%

Starts-Stops/hr:-60, 150 , 300

VFD

Frame- 71-400

KW rating:- 0.25KW to 560KW

Pole:-4, 6 & 8 pole

CDF:- 25%, 40%, 60%, 100%

Starts-Stops/hr:-60, 150 , 300

Standard Operating conditions

Voltage 415V+/-10%

Frequency 50Hz+/-5%

Combined Voltage & Frequency variation +/-10% (absolute sum)

Ambient temperature:- 50 deg /45 deg

Altitude:-1000m

Standards:-

The motors manufactured under crane duty area comply to the following standards:-

IS:325

IS:4722

IS:1231

IS:2223

IS:3177

IEC:60034-1

IS:4137

Deration Factors for ambient temp:-

Permissible Output	100%	95%	90%
Amb. Temp.	50°	55°	60°

Motor Selection Procedure:-

FOR DOL :-

The motors are selected from the chart after matching the required starts stops per hour & corresponding CDF .

FOR VFD :-

The motors are selected from the chart based on the given mechanical KW .The final motor KW is selected based on the starts stops per hour , CDF & deration on account of Drive. Depending upon the type of crane employed , user has to take applicable service factor as per IS 2231& IS4137 & correct the mechanical KW accordingly. The permissible temperature rise i.e, Class B will be corresponding to the given mechanical KW .

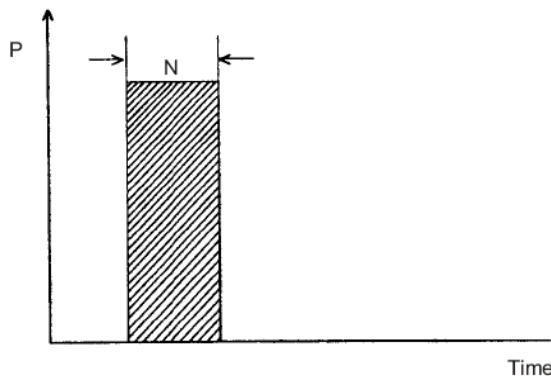

Any deration required on account of higher ambient temperature should be considered separately based on the above table applicable for both DOL & VFD operation.

Duty Cycle:-

The duty types are indicated by the symbols S1 ... S9 according to IS:12824-1989. The outputs given in the tables are based on continuous running duty. S1 with rated output.

S2 Short-time duty

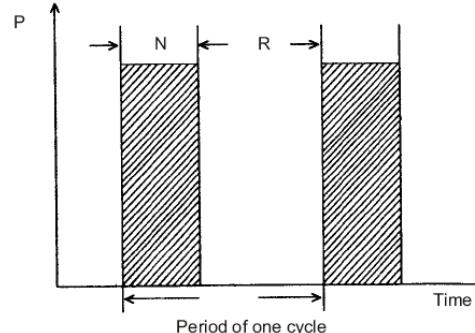

Operation at constant load during a given time, less than required to reach thermal equilibrium, followed by a rest and de-energised period of sufficient duration to re-establish motor temperatures equal to the ambient or the coolant temperature. The values 10, 30, 60 and 90 minutes are recommended for the rated duration of the duty cycle. Designation e.g. S2 60 min.

S3 Intermittent duty

A sequence of identical cycles, each including a period of operation at constant

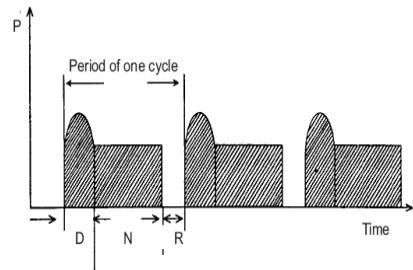

load & a rest & de-energised period. The period is

too short for thermal equilibrium to be obtained. The starting current does not significantly affect the temperature rise. Recommended values for the cyclic duration factor are 15, 25, 40 and 60%. The duration of the duty cycle is 10 min. Designation e.g. S3 25%

S4 Intermittent duty with starting

A sequence of identical duty cycles, each cycle including a significant period of starting, a period of operation at constant load and rest and de-energised period. The period

P = Output power
D = Starting
N = Operation under rated condition
F = Electrical braking

V = Operation of no load
R = At rest and de-energised

is too short for thermal equilibrium to be obtained. In this duty type the motor is brought to rest by the load or by mechanical braking, where the motor is not thermally loaded. After the duty type the following factors must be indicated; the cyclic duration factor; the number of

duty cycles per hour (c/h); the factor of inertia FI; the moment of inertia, J, of the motor rotor; and the permissible Maverage moment of resistance, T, during the change of the Vspeed given with the rated load torque. The factor inertia FI is the ratio of the total moment of inertia, to the moment of inertia of the motor rotor.2Designation e.g. S4 - 25% - 129 c/h - FI.2 - J= 0,1 kgm - T = M V0,5 T.V

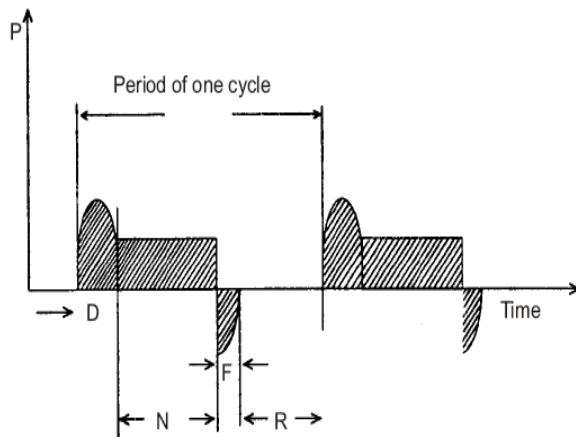

S5 Intermittent duty with starting and electrical braking .

A sequence of identical duty cycles, each cycle consisting of a significant period of starting, a period of operation at constant load, a period of rapid electric braking and a rest and de-energised period. The period is too short for thermal equilibrium to be obtained. After the duty type the following factors must be indicated: the cyclic duration factor; the number of duty types per hour (c/h); the factor of inertia FI; the moment of inertia J, of the motor, and the Mpermissible moment of resistance T (see duty type S4.)V2Designation e.g. S5-40% -120 c/h- FI.3 - J= 1,3 kgm - T = 0,3 T.

Enquiries :

The following information should be included during enquiry stage: -

- a)Application.
- b)Voltage and frequency variations.
- c)Ambient temperature, and type of protection
- d)Mechanical KW with service factor as applicable according to crane employed
- e)No. of starts/stops per hour with duty and CDF.
- f)Type of starting
- g)Load GD2 at motor speed.
- h)Load torque ; or Torque/Speed curve of driven equipment.
- i) Duty cycle diagram, if other than those described earlier.

- Note:** 1..All crane duty motors are suitable for VFD supply subject to proper selection using ABB Drive Size Software considering required BKW, speed range and constant torque appln.
 2. All crane duty motors shall be offered as MI motors
 3. Load GD Sq value should not be more than motor GD sq value.
 4. Motors for frame size 225 and higher can be offered against enquiry
 5)For class H insulation & temperature rise limited to Class F , 15% higher KW can be considered.

Note:-

1)Maximum permissible Mechanical KW has been calculated based on VVVF supply & duty cycles

2)Separate derations are required for different service factors for different cranes & ambient temperature

3)Speed range 10-100%

4)Load GD square is assumed to be equal to motor GD square

5)For class H insulation & temperature rise limited to Class F , 15% higher mechanical KW can be considered.

Crane Duty Motors Chart

(For VVVF Drive Only)

Series Name-KHX+ & M2BA

Enclosure-TEFC

Protection/Cooling-IP55 / IC411

Insulation class-F

Temperature rise Class-B

415V±10%

50Hz±5%

Ambient -50 deg

Duty -S4 & S5 (equivalent)

Pole-8
